Aldgate Grind

Your task is to develop a coffee shop app using Angular JS.
Use mock data to display a list of the following beverages:

Item	Price
Latte	2.50
Cappuccino	2.50
Tea	2.00
Flat White	2.50
Espresso	2.00

And the following extras:

Item	Price
Extra Shot	1.00
Chocolate	0.50
Vanilla	0.50
Caramel	0.50
Mint	0.50
Ginger	0.50
Honey	0.50

A customer can select any beverage with up to 2 extras.

Constraints:

Tea can **only** be ordered with Mint, Ginger or Honey
Coffee can be ordered with any extra **except** Mint

Once an order has been placed the total amount should be displayed to the user.

Bonus:

Create a Rails API to drive the AngularJS app and persist the orders once they've been created.

The API should have two models: Item and Order.
The API should store the customer's name and email address with each order

Good luck & happy coding!
